

The Invention Claimed Is:

1. A method of inspecting a semiconductor wafer for defects using captured image analysis comprising:

positioning the wafer with an edge thereof relative to an image capturing device;

5 rotating the wafer;

scanning the edge of the rotating wafer with the image capturing device;

recording an image of the scanned wafer from the image capturing device into a database;

10 instructing a computer to analyze the recorded images of the scanned wafer;

identifying any defects in the analyzed recorded images; and  
upon identifying any defects, recording defect information related to each defect.

2. A method as defined in claim 1 wherein:

the image capturing device includes one of a scanning electron microscope and an optical review system.

3. A method as defined in claim 1 further comprising:

before scanning the edge of the wafer, setting an inspection recipe including at least one of: angle of the image capturing device relative to the edge of the wafer, magnification of the image capturing device, focus of the image capturing device, brightness of an illumination source that illuminates the edge of the wafer, portion of the edge of the wafer to be scanned, rotational speed of the wafer, and accelerating voltage of an electron beam.

4. A method as defined in claim 1 further comprising:

positioning the image capturing device at a desired angle relative to the edge of the wafer before scanning the edge; and wherein:

the image recording step further comprises:

5 recording the image of a desired portion of the edge of the wafer.

5. A method as defined in claim 1 wherein:  
the scanning step further comprises:  
scanning the edge of the wafer from a region interior of a top of the edge to a region exterior of a bottom of the edge.
6. A method as defined in claim 1 wherein the aforementioned steps are performed after a first process step, further comprising:  
after a second process step, repeating the aforementioned steps; and  
comparing the defect information recorded after the first process step  
5 to the defect information recorded after the second process step to locate any added defects.
7. A method as defined in claim 1 wherein the aforementioned steps are performed after a first process step, further comprising:  
after a second process step, repeating the aforementioned steps; and  
comparing the defect information recorded after the first process step  
5 to the defect information recorded after the second process step to locate any repaired defects.
8. A method as defined in claim 1 wherein:  
the defect identifying step further comprises:  
comparing the recorded image of the scanned wafer to a recorded image of a wafer having no defects.
9. A method as defined in claim 1 further comprising:  
upon identifying any defects, categorizing each defect as being one of a crack, a chip, a flake, a contamination and presence of a particle.
10. A method of inspecting an edge of a semiconductor wafer for defects during fabrication of integrated circuit components on the semiconductor wafer within a fabrication system that includes a plurality of fabrication stations arranged in a processing order and within which a variety of process steps are performed on  
5 a plurality of wafers, comprising:  
providing a plurality of inspection stations within the fabrication system corresponding to selected ones of the fabrication stations, each inspection

station being located in a subsequent processing order to a corresponding one of the selected fabrication stations;

- 10                    processing a wafer in a first fabrication station;  
                         automatically inspecting an edge of the wafer in a first inspection  
station;  
                         automatically recording a first set of defects in the edge of the wafer;  
                         processing the wafer in a second fabrication station;  
15                    automatically inspecting the edge of the wafer in a second inspection  
station; and  
                         automatically recording a second set of defects in the edge of the  
wafer.

11.    A method as defined in claim 10 further comprising:  
         determining a difference between the first and second sets of defects.

12.    A method as defined in claim 11 further comprising:  
         identifying process-induced edge defects from the determined  
difference between the first and second sets of defects.

13.    A method of inspecting an edge of semiconductor wafers for defects  
during fabrication of integrated circuit components on the semiconductor wafers  
within a fabrication system that includes a plurality of fabrication stations arranged  
in a processing order and within which a variety of process steps are performed on  
5 a plurality of wafers, comprising:

- providing a plurality of inspection stations within the fabrication  
system corresponding to selected ones of the fabrication stations, each inspection  
station being located in a subsequent processing order to a corresponding one of  
the selected fabrication stations;  
10                    processing the wafers in the fabrication stations;  
                         inspecting the edge of the wafers in the inspection stations;  
                         upon inspecting each wafer, recording an image of the edge of the  
wafer; and

correlating each recorded image with the wafer from which it was  
15 taken and the process step after which it was taken.

14. A method as defined in claim 13 further comprising:  
selecting a recorded image from among a plurality of the recorded  
images by specifying the wafer from which it was taken and the process step after  
which it was taken; and  
5 determining whether any defects were present on the edge of the  
specified wafer at a time that the selected recorded image was taken of the edge of  
the specified wafer by analyzing the selected recorded image.

15. A method as defined in claim 13 further comprising:  
selecting two recorded images from among a plurality of the recorded  
images by specifying the wafer from which both images were taken and the two  
process steps after which each selected image was taken;  
5 determining any defects that were present on the edge of the  
specified wafer at times that the two selected recorded images were taken of the  
edge of the specified wafer by analyzing the two selected recorded images; and  
determining whether any defects were added to the edge of the  
specified wafer between the times that the two selected recorded images were  
10 taken by comparing the determined defects from the analyzing of the two selected  
recorded images.

16. A wafer edge defect inspection system comprising:  
an image capturing device next to which a wafer can be positioned,  
the image capturing device being oriented to view at least a portion of an edge of  
the wafer, the image capturing device automatically generating an image of the  
5 edge of the wafer;  
a database connected to the image capturing device to receive the  
generated image of the edge of the wafer, the database automatically storing the  
received image for subsequent analysis; and  
a computer connected to the database to retrieve the stored image

10 upon instruction from a user to perform image analysis to locate any defects in the edge of the wafer.

17. A wafer edge defect inspection system as defined in claim 16,  
wherein the image capturing device is a first image capturing device, the image  
generated thereby is a first image and the wafer edge defect inspection system is  
incorporated into a fabrication system having a plurality of fabrication stations for  
5 processing the wafer and forming integrated circuit components thereon, further  
comprising:

a second image capturing device next to which the wafer can be  
positioned, the second image capturing device being oriented to view at least the  
portion of the edge of the wafer, the second image capturing device automatically  
10 generating a second image of the edge of the wafer and being connected to the  
database to supply the second image to the database;

and wherein:

the database automatically stores the second image for subsequent  
analysis by the computer;

15 the first image capturing device is incorporated into the fabrication  
system to receive the wafer after a first fabrication station performs a first process  
step on the wafer and the first image capturing device generates the first image of  
the edge of the wafer after the first process step;

the second image capturing device is incorporated into the fabrication  
20 system to receive the wafer after a second fabrication station performs a second  
process step on the wafer and the second image capturing device generates the  
second image of the edge of the wafer after the second process step; and

the computer retrieves the stored first and second images upon  
instruction from the user to compare and analyze the first and second images  
25 together.

18. A wafer edge defect inspection system as defined in claim 17,  
wherein:

the computer compares and analyzes the first and second images

together upon instruction from the user to determine whether any defects have  
5 been added to the edge of the wafer between times that the first and second  
images thereof are generated.

19. A wafer edge defect inspection system as defined in claim 17  
wherein:

the computer compares and analyzes the first and second images  
together upon instruction from the user to determine whether any defects have  
5 been repaired on the edge of the wafer between times that the first and second  
images thereof are generated.

20. A wafer edge defect inspection system as defined in claim 16  
incorporated into a fabrication system having a plurality of fabrication stations  
within which the wafer is subjected to process steps to form integrated circuit  
components thereon, and wherein:

5 at least a portion of the located defects are caused by at least one of  
the process steps to which the wafer is subjected before the image capturing  
device automatically generates the image of the edge of the wafer.
